

No Knowledge

By: Carter Philo

The pile of rancid trash grows higher and higher until making a mountain of immovable refuse. Would you do something to stop it? I believe that all elementary school teachers should be required by law to teach their students in grades K-4 about recycling. This will change the world for the better because, it will help Reduce landfills from growing larger, it will raise awareness to the world that this recycling drought persists as a serious problem, and it will start generations of good recycling habits. Now join me for a brief informational paragraph so we can learn about the effects of what no knowledge on recycling can do to our world and economy.

In the light of this major recycling problem you may wonder, what landfills and recycling have to do with each other. First of all the landfills will be the extinction of decomposers in the world. Decomposers are animals such as fungi who decompose organic remains of animals or natural materials no longer in use. This would happen because of the lack of biodegradable things that it decomposes. That would be due to the trash being piled on top of landfills. As a result the decomposers can't travel there or they would die from a humongous lack of nutrients. Also other living organisms would die because the decomposers are a huge part of almost every ecosystem and that could cause almost all of mankind to die

because of this major collapse in the ecosystem. Let's take a crucial step towards a monumental change in our world!

, educating kids about recycling will reduce landfills from growing to large. This landfill reduction act will be an important part of the recycling curriculum. Preventing landfills is not the goal, because what's done is done. The goal is to reduce the trash from going into the landfills, so the landfills don't grow larger. If we can raise recycling rates landfills won't increase as rapidly as they are now. I can see where some people might think this would be a large hassle. For it's just recycling. Though, in the long run it will help the world and humanity's future. All naughty things such as landfills and pollution can be reduced. This will happen by making teachers teach their kids about recycling. Kids can take this knowledge and use it for their entire life.

Generally, when something positive prevails and educates people it raises awareness on the main subject. In this case recycling stakes itself as the acknowledged topic. As a result, if teachers start educating their elementary school students about recycling it will raise awareness about how large an issue recycling is. Also it will show that so many people, not only in America. That recycling has entered a crisis, and we're the only ones who can stop it. Also, if this recycling curriculum raises awareness more will be done to stop it. For instance, if people get word of this new recycling curriculum people might do things to help, such as holding classes to educate people on the

topic of recycling. I can see where someone might have the thought that raising awareness wouldn't affect this crisis in a positive way, because it would be just another news story. However, I think that if we raise awareness there will be the people who will stand up for what is right for our world avert this recycling crisis. Everyone who wants to help save our world get out there and save our planet by recycling!

Unmistakably, education on recycling will lead to long term good habits for generations. This will lead to healthier lives and a better world. I can see where some one might think that some people might not pass down the knowledge of recycling. Whereas, I think if you are being taught about the same topic over and over again for all of elementary school it is very unlikely that people would forget. However, even if some people did forget they would still have done there part in raising awareness and recycling for at least a few years. All you recyclers get out there and show the world what you want to change not only the Earth, but change billions of poor lives for the better.

All in all, you just need to take one step at a time to educate elementary schoolers in grades K through 4 on recycling. You can do this by following this new recycling law which will reduce landfill masses, raise awareness for this humungous problem, and help start generations of good recycling habits. So get out there and take these steps for our Earth!
