

6.1.20

2d Motion: Projectiles

Today's Objectives:

- Start Projectile Chapter
- What is a projectile?
- What equations calculate their motion?

If you fire a bullet and drop another bullet, which one hits the ground first?

2D Motion: Projectiles

Examples: baseball, basketball, bullet, cannonball

Anything thrown
or fired
(No engine)

What forces are acting on the baseball after it's thrown?

Gravity
Only! $\downarrow F_g$

(No applied, air resistance)

The motion of a projectile can be split into two parts:

↔ 1) Horizontal (c.v.)

↓ 2) Vertical (Speeds Up)

When a plane drops a package, what path does the package follow?

Parabolic
Trajectory
(1/2 Rainbow)

Note: the package
doesn't fall straight
down, it keeps moving
to the right as it falls!

If you are riding a motorcycle and fire a flare upwards, where will the flare land? (No Air Resistance)

**On you!!!,
remember it keeps moving to the right with you.**

If you shoot a bullet and drop another one,
which one will hit the ground first?

Same
Time!

(fall the same vertical distance)
