

# Linear Motion Graphs

## \* Position graphs

- positive slope  $\Rightarrow$  moving North
- negative slope  $\Rightarrow$  moving South
- steep slope  $\Rightarrow$  moving fast
- shallow slope  $\Rightarrow$  moving slow
- flat line  $\Rightarrow$  not moving

Slope equation: slope = velocity

$$V = \frac{\Delta X}{\Delta t}$$

- curved slope  $\Rightarrow$  speed is changing  $\Rightarrow$  there is acceleration

## Velocity graphs

- positive slope  $\Rightarrow$   $\left\{ \begin{array}{l} \text{speeding up (above t-axis)} \\ \text{slowing down (below t-axis)} \end{array} \right.$

- negative slope  $\left\{ \begin{array}{l} \text{slowing down (above t-axis)} \\ \text{speeding up (below t-axis)} \end{array} \right.$

- Flat line  $\Rightarrow$  constant velocity

- touches t-axis  $\Rightarrow$  stop or turning point
- above t-axis  $\Rightarrow$  moving North
- below t-axis  $\Rightarrow$  moving South
- Slope formula: slope =  $a = \frac{v_f - v_i}{\Delta t}$  acceleration

Is object accelerating?

yes  
↓

no  
↓

$$\Delta x = v_i \Delta t + \frac{1}{2} a \Delta t^2$$

$$v = \frac{\Delta x}{\Delta t}$$

$$\Delta x = \left( \frac{v_i + v_f}{2} \right) \Delta t$$

$$v_f^2 = v_i^2 + 2a\Delta x$$

$$a = \frac{v_f - v_i}{\Delta t}$$

\* Special case

free-fall  $a = -9.8 \frac{m}{s^2}$

\* If you drop object,  
final velocity  $\neq 0$

NO  
air

Fall to  
the ground  
@ same time  
hit the  
ground  
w/ same  
speed
