

# AP CALCULUS

## Stuff you MUST know Cold

\* topic only on BC

**Basic Derivatives**  
 where  $u$  is a function of  $x$ , and  $a$  is a constant.

$$\frac{d}{dx}(x^n) = nx^{n-1}$$

$$\frac{d}{dx}(\sin x) = \cos x$$

$$\frac{d}{dx}(\cos x) = -\sin x$$

$$\frac{d}{dx}(\tan x) = \sec^2 x$$

$$\frac{d}{dx}(\cot x) = -\csc^2 x$$

$$\frac{d}{dx}(\sec x) = \sec x \tan x$$

$$\frac{d}{dx}(\csc x) = -\csc x \cot x$$

$$\frac{d}{dx}(\ln u) = \frac{1}{u} \frac{du}{dx}$$

$$\frac{d}{dx}(\log_a x) = \frac{1}{x \ln a}$$

$$\frac{d}{dx}(e^u) = e^u \frac{du}{dx}$$

$$\frac{d}{dx}(a^{u(x)}) = a^{u(x)} \ln a \cdot \frac{du}{dx}$$

$$\frac{d}{dx}(\sin^{-1} u) = \frac{1}{\sqrt{1-u^2}} \frac{du}{dx}$$

$$\frac{d}{dx}(\cos^{-1} x) = \frac{-1}{\sqrt{1-x^2}}$$

$$\frac{d}{dx}(\tan^{-1} u) = \frac{1}{1+u^2} \cdot \frac{du}{dx}$$

$$\frac{d}{dx}(\cot^{-1} x) = \frac{-1}{1+x^2}$$

$$\frac{d}{dx}(\sec^{-1} u) = \frac{1}{|u|\sqrt{u^2-1}} \cdot \frac{du}{dx}$$

$$\frac{d}{dx}(\csc^{-1} x) = \frac{-1}{|x|\sqrt{x^2-1}}$$

**Differentiation Rules**  
 Chain Rule  $\frac{d}{dx}[f(g(x))] = f'(g(x))g'(x)$   
 Product Rule  $\frac{d}{dx}(uv) = u \frac{dv}{dx} + v \frac{du}{dx}$   
 Quotient Rule  $\frac{d}{dx}\left(\frac{u}{v}\right) = \frac{v \frac{du}{dx} - u \frac{dv}{dx}}{v^2}$

**Some handy INTEGRALS:**  
 $\int \tan x \, dx = \ln|\sec x| + C$   
 $= -\ln|\cos x| + C$   
 $\int \sec x \, dx = \ln|\sec x + \tan x| + C$

**Curve sketching and analysis**  
 $y = f(x)$  must be continuous at each:

**critical point:**  $\frac{dy}{dx} = 0$  or undefined

**inc/dec. function  $f(x)$ :**  $f' > 0, f' < 0$

**concavity  $\equiv$  inc/dec slope:**  $f'' > 0, f'' < 0$

**local minimum:**  
 $\frac{dy}{dx}$  goes  $(-, 0, +)$  or  $(-, \text{DNE}, +)$  or  $\frac{d^2y}{dx^2} > 0$

**local maximum:**  
 $\frac{dy}{dx}$  goes  $(+, 0, -)$  or  $(+, \text{DNE}, -)$  or  $\frac{d^2y}{dx^2} < 0$

**point of inflection:**  
 $f'' = 0$  or DNE AND concavity changes

$\frac{d^2y}{dx^2}$  goes from  $(+ \text{ to } -)$ ,  $(- \text{ to } +)$ ,

**Abs. Max/Min:** eval. crit # & endpts.  
 OR discuss "always inc or always dec."

**Intermediate Value Theorem:**  
 If the function  $f(x)$  is continuous on  $[a, b]$ , for all  $k$  between  $f(a)$  and  $f(b)$ , there exists at least one number  $x = c$  in the open interval  $(a, b)$  such that  $f(c) = k$ .

**Extreme Value Theorem:**  
 If the function  $f(x)$  is continuous on  $[a, b]$ , then there exists an absolute max and min on that interval.

**Rolle's Theorem:**  
 If the function  $f(x)$  is continuous on  $[a, b]$ , AND differential on the interval  $(a, b)$ , AND  $f(a) = f(b)$ , then there is at least one number  $x = c$  in  $(a, b)$  such that  $f'(c) = 0$

**Mean Value Theorem:**  $m_{\text{secant}} = m_{\text{tangent}}$   
 If the function  $f(x)$  is continuous on  $[a, b]$ , AND differential on the interval  $(a, b)$ , then there is at least one number  $x = c$  in  $(a, b)$  such that  $f'(c) = \frac{f(b) - f(a)}{b - a}$ .

**MVT of Integrals i.e. AVERAGE VALUE:**  
 If the function  $f(x)$  is continuous on  $[a, b]$  and differential on the interval  $(a, b)$ , then there exists at least one number  $x = c$  on  $(a, b)$  such that  $f(c)(b - a) = \int_a^b f(x) \, dx$   
 $\text{Area}_{\text{rectangle}} = \text{Net Area}_{\text{Integral}}$   
 $f(c) = \frac{1}{(b-a)} \int_a^b f(x) \, dx$   
 This value  $f(c)$  is the "average value" of the function on the interval  $[a, b]$ .

**Limit Strategies:** Factor and cancel, Rationalize Numerator, u-sub, HA rules:  
 $\lim_{x \rightarrow \infty} \frac{a x}{\sqrt{bx^2 + c}} = \frac{a}{\sqrt{b}}$   
 2 HA  $\lim_{x \rightarrow \infty} \frac{a x}{\sqrt{bx^2 + c}} = \frac{-a}{\sqrt{b}}$

**To find all HA:** Take limit as  $x \rightarrow \text{both } \pm \infty$

**Approximation Methods for Integration**  
**Use Geometry formulas**  
**Rectangles** - Left, Right and Middle  
 Riemann Sums  $A = bh$   
**Trapezoids:**  $A = \frac{1}{2}(b_1 + b_2)h$   
 (Effects of inc/dec & concavity on approx.)  
 Concave up: M under estimate, T over estimate  
 Concave down: M over estimate, T under estimate  
 Inc: L=under, R=over. Dec: L = over, R = under

**First Fundamental Th. of Calculus**  
 $\int_a^b f'(x) \, dx = f(b) - f(a)$

**2nd Fundamental Th. of Calculus**  
 $\frac{d}{dx} \int_{a(x)}^{b(x)} f(t) \, dt = f(b(x))b'(x) - f(a(x))a'(x)$

**Solids of Revolution and friends**  
**Disk Method**  
 $V = \pi \int_a^b [R(x)]^2 \, dx$   
**Washer Method**  
 $V = \pi \int_a^b ([R(x)]^2 - [r(x)]^2) \, dx$   
 volume by cross section (not rotated)  
 $V = \int_a^b \text{Area}(x) \, dx$   
 $A_{\text{eq. lat. } \Delta} = \frac{s^2}{4} \sqrt{3}$   
 \*Arc Length  $s = \int_a^b \sqrt{1 + [f'(x)]^2} \, dx$   
 \*Surface Area  
 $SA = 2\pi \int_a^b \text{radius} \sqrt{1 + [f'(x)]^2} \, dx$

**Distance, Velocity, and Acceleration**  
 velocity =  $\frac{d}{dt}$  (position)  
 acceleration =  $\frac{d}{dt}$  (velocity)  
 \*velocity vector =  $\left\langle \frac{dx}{dt}, \frac{dy}{dt} \right\rangle$   
 speed =  $\|v\| = \sqrt{(x')^2 + (y')^2}$  \*  
 displacement =  $\int_{t_0}^{t_f} v \, dt$   
 total distance =  $\int_{\text{initial time}}^{\text{final time}} |v| \, dt$   
 $\int_{t_0}^{t_f} \sqrt{(x')^2 + (y')^2} \, dt$  \*  
 Av. velocity =  $\frac{1}{b-a} \int_a^b v(t) \, dt = \frac{s(b) - s(a)}{b-a}$   
 $\frac{1}{b-a} \int_a^b \sqrt{[x'(t)]^2 + [y'(t)]^2} \, dt$  \*

**BC TOPICS and important TRIG identities and values:**

<p><b>L'Hôpital's Rule</b>                  If <math>\frac{f(a)}{g(b)} = \frac{0}{0}</math> or <math>\frac{\infty}{\infty}</math>,                  then <math>\lim_{x \rightarrow a} \frac{f(x)}{g(x)} = \lim_{x \rightarrow a} \frac{f'(x)}{g'(x)}</math></p>	<p><b>Slope of a Parametric equation</b>                  Given <math>x(t)</math> and <math>y(t)</math>, the slope is  <math>\frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}}, \quad \frac{d^2y}{dx^2} = \frac{D_t \left( \frac{dy}{dx} \right)}{\frac{dx}{dt}}</math></p>	<p align="center"><b>Values of Trigonometric Functions for Common Angles</b></p> <table border="1"> <thead> <tr> <th><math>\theta</math></th> <th><math>\sin \theta</math></th> <th><math>\cos \theta</math></th> <th><math>\tan \theta</math></th> </tr> </thead> <tbody> <tr> <td><math>0^\circ</math></td> <td>0</td> <td>1</td> <td>0</td> </tr> <tr> <td><math>\frac{\pi}{6}</math></td> <td><math>\frac{1}{2}</math></td> <td><math>\frac{\sqrt{3}}{2}</math></td> <td><math>\frac{\sqrt{3}}{3}</math></td> </tr> <tr> <td><math>\frac{\pi}{4}</math></td> <td><math>\frac{\sqrt{2}}{2}</math></td> <td><math>\frac{\sqrt{2}}{2}</math></td> <td>1</td> </tr> <tr> <td><math>\frac{\pi}{3}</math></td> <td><math>\frac{\sqrt{3}}{2}</math></td> <td><math>\frac{1}{2}</math></td> <td><math>\sqrt{3}</math></td> </tr> <tr> <td><math>\frac{\pi}{2}</math></td> <td>1</td> <td>0</td> <td>"<math>\infty</math>"</td> </tr> <tr> <td><math>\pi</math></td> <td>0</td> <td>-1</td> <td>0</td> </tr> </tbody> </table>	$\theta$	$\sin \theta$	$\cos \theta$	$\tan \theta$	$0^\circ$	0	1	0	$\frac{\pi}{6}$	$\frac{1}{2}$	$\frac{\sqrt{3}}{2}$	$\frac{\sqrt{3}}{3}$	$\frac{\pi}{4}$	$\frac{\sqrt{2}}{2}$	$\frac{\sqrt{2}}{2}$	1	$\frac{\pi}{3}$	$\frac{\sqrt{3}}{2}$	$\frac{1}{2}$	$\sqrt{3}$	$\frac{\pi}{2}$	1	0	" $\infty$ "	$\pi$	0	-1	0
