

Academic Chemistry – Unit 3 Review

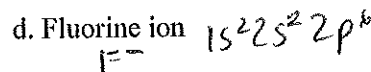

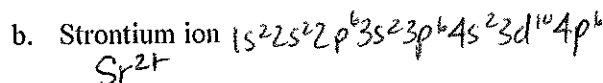

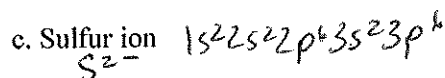

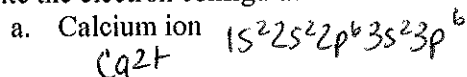

Chapter 7 – Ionic & Metallic Bonding

- The electrons in the highest occupied energy level of an atom are called the VALENCE electrons.
- The OCTET rule states that atoms in compounds tend to have the electron configuration of a noble gas.
- Oxygen atoms attain a stable electron configuration by GAINING two electrons.
- Ionic compounds are composed of METALS and NON METALS which are arranged in a repeating 3D crystal structure. This structure makes these compounds BRITTLE. When DISSOLVED OR MELTED, ionic compounds can conduct electricity.

5. Determine the number of valence electrons in each of the following and then draw a Lewis dot structure:

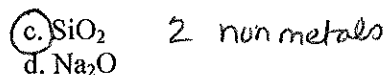

6. Write the electron configuration for the following:

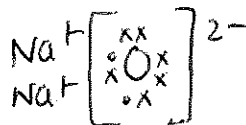

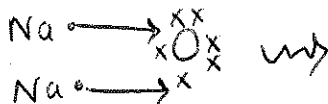

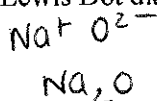

7. Which of these is not an ionic compound?

- KF
- Na_2SO_4

8. Using Lewis Dot diagrams, show how an ionic bond of sodium oxide is formed.

9. Describe how a metallic bond is formed.

metal atoms get close to each other so "d" orbitals can overlap. This allows e^- to become delocalized creating \oplus metal cations & free "sea of e^- ". This opposite attraction of \oplus & \ominus makes the bond.

Chapter 8 – Covalent Bonding

1. Covalent bonds occur between NON METALS and NON METALS due to the SHARING of electrons.

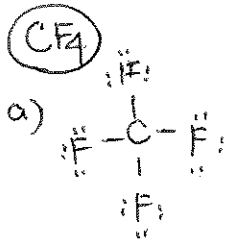

2. How many electrons are shared in the following bonds?

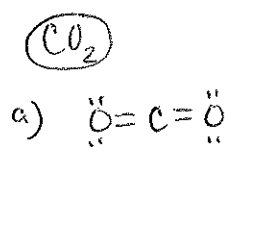

3. For the following compounds – CF_4 , CO_2 , NH_3 , N_2 , BF_3 , CH_2Cl_2 , H_2O – do the following:

- Draw the Lewis Dot structure
- Determine the number of lone pair electrons on the central atom
- Determine the number of atoms bonded to the central atom
- Indicate the VSEPR geometry for each molecule
- Determine if the bonds are nonpolar covalent or polar covalent
- Determine if the molecule is nonpolar or polar
- Determine the type(s) of intermolecular attractions (dispersion, dipole, hydrogen bonding)
- Calculate the bond dissociation energy for all bonds in the molecules (except BF_3)

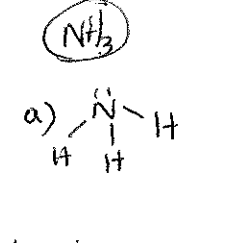

See next page for answer to all questions

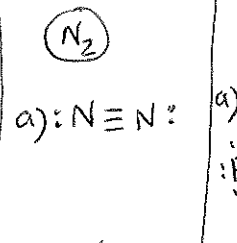

- b) \emptyset
 c) 4
 d) Tetrahedral
 e) $4.0 - 2.5 = 1.5$
 polar covalent
 f) non polar
 g) dispersion
 h) $552 \times 4 = 2208 \text{ kJ/mol}$

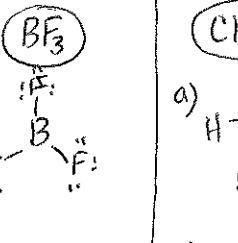

- b) \emptyset
 c) 2
 d) Linear
 e) $3.5 - 2.5 = 1.0$
 polar covalent
 f) non polar
 g) dispersion
 h) $805 \times 2 = 1610 \text{ kJ/mol}$

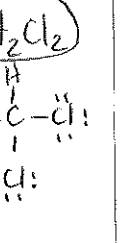

- b) 1
 c) 3
 d) Trigonal pyramidal
 e) $3.0 - 2.1 = 0.9$
 polar covalent
 f) polar
 g) All 3
 h) $393 \times 3 = 1179 \text{ kJ/mol}$

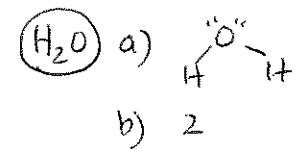

- b) \emptyset
 c) \emptyset
 d) Linear
 e) $3.0 - 3.0 = 0$
 non polar covalent
 f) non polar
 g) dispersion
 h) 941 kJ/mol

- b) \emptyset
 c) 3
 d) Trigonal planar
 e) -
 f) -
 g) -
 h) can't calculate

- b) \emptyset
 c) 4
 d) Tetrahedral
 e) $\text{CH} - 2.5 - 2.1 = 0.4$
 non polar cov.
 $\text{CCl} - 3.0 - 2.5 = 0.5$
 polar covalent
 f) polar
 g) All 3
 h) $413 \times 2 = 826$
 $397 \times 2 = 794$

- b) 2
 c) 2
 d) Bent
 e) $3.5 - 2.1 = 1.4$
 polar covalent
 f) polar
 g) All 3
 h) $464 \times 2 = 928 \text{ kJ/mol}$

4. Order the types of bonds from strongest to weakest: London dispersion forces, hydrogen bonds, dipole interactions, ionic bonds, covalent bonds.

ionic bonds, covalent bonds, hydrogen bonds, dipole interactions, London dispersion forces

5. Which of these molecules can form a hydrogen bond with a water molecule?

- a. N₂ non polar
 b. NH₃ polar
 c. O₂ non polar
 d. CH₄ non polar

→ must be polar molecule & have H w/ another highly electronegative element (N, O, Cl, F)

Chapter 9 - Chemical Names & Formula
 M - molecular, I - ionic, A - acid

- | | | |
|--|--|--|
| M 1. nitrogen trifluoride NF_3 | M 9. phosphorus triiodide PI_3 | A 17. H_2SO_3 sulfurous acid |
| I 2. barium phosphide Ba_3P_2
<small>$\text{Ba}^{+2} \text{P}^{3-}$</small> | M 10. disulfur decafluoride S_2F_{10} | M 18. CCl_4 carbon tetrachloride |
| M 3. P_4O_{10} tetraphosphorus decoxide | I 11. K_2S potassium sulfide | I 19. calcium iodide CaI_2
<small>$\text{Ca}^{+2} \text{I}^{-}$</small> |
| M 4. SCl_2 sulfur dichloride | I 12. NiSO_4 Nickel (II) sulfate
<small>$\text{Ni}^{+2} \text{SO}_4^{2-}$</small> | A 20. hydrobromic acid HBr
<small>$\text{H}^+ \text{Br}^-$</small> |
| I 5. $\text{Cu}(\text{OH})_3$ copper (III) Hydroxide
<small>$\text{Cu}^{+3} \text{OH}^-$</small> | I 13. aluminum phosphate AlPO_4
<small>$\text{Al}^{+3} \text{PO}_4^{3-}$</small> | A 21. bromic acid HBrO_3
<small>$\text{H}^+ \text{BrO}_3^-$</small> |
| I 6. ammonium carbonate $(\text{NH}_4)_2\text{CO}_3$
<small>$\text{NH}_4^+ \text{CO}_3^{2-}$</small> | I 14. magnesium perchlorate $\text{Mg}(\text{ClO}_4)_2$
<small>$\text{Mg}^{+2} \text{ClO}_4^-$</small> | I 22. SrCl_2 Strontium chloride |
| A 7. carbonic acid H_2CO_3
<small>$\text{H}^+ \text{CO}_3^{2-}$</small> | I 15. iron (III) sulfide Fe_2S_3
<small>$\text{Fe}^{+3} \text{S}^{2-}$</small> | I 23. PbS Lead (II) sulfide |
| A 8. HCl hydrochloric acid | M 16. dinitrogen monoxide N_2O | M 24. dinitrogen tetroxide N_2O_4 |

1620 kJ/mol
