## Core Concepts

- Students will understand current, voltage, and resistance and their relationship (Ohm's Law) and will be able to use Ohm's Law to perform calculation in simple circuits.
- Students will understand electric power and will be able to calculate the power and energy used by an electrical device.
- Students will understand series and parallel circuits, sketch schematic diagrams and be able to compare and contrast practical applications of series and parallel circuits.
- Identify relationships between current and voltage in series and parallel circuits.
- Honors: Students will understand simple combination circuits and how to calculate voltage, current or resistance.
