

AP E&M Unit 2 Worksheet 4

1. Sketch the electric field lines and equipotential lines for the following charges:

Charged on AP

\vec{E} field is \perp to equipotential surfaces
That's where I am worried about

2. The work done to move a charge ($q = 3.7 \times 10^{-5} \text{ C}$) at a steady speed is $4.4 \times 10^{-4} \text{ J}$.
- Find the difference in electric potential energy of the charge between the two points. $4.4 \times 10^{-4} \text{ J}$
 - Determine the potential difference between the two points.

$\Delta V = \frac{W}{q} = \frac{4.4 \times 10^{-4}}{3.7 \times 10^{-5}} = 11.9 \text{ V}$

3. A point charge of $+4 \text{ C}$ creates a field.
- What direction is the field from this charge? Δturn
 - What is the potential difference (referencing infinity to be zero) 2 cm from the charge?
 - 12 cm from the charge?
 - What is the electric field created between these two potentials?

b) $V = \frac{kq}{r} = \frac{(8.99 \times 10^9)(4)}{0.02} = 1.798 \times 10^{12} \text{ V}$

c) $V = \frac{kq}{r} = \frac{(8.99 \times 10^9)(4)}{0.12} = 3.5 \times 10^{11} \text{ V}$

$\Delta V = 1.5 \times 10^{12}$

$E = 1.5 \times 10^{13} \text{ V/m}$

4. The positive terminal of an x-ray tube has a potential of $125,000 \text{ V}$ relative to the negative terminal.
- How much work is done to accelerate an electron through the x-ray tube?
 - If the electron is initially at rest, how much kinetic energy does it have when it gets to the negative terminal of the tube?
 - How fast is the electron moving?

a) $\Delta V = \frac{W}{q}$

$W = q\Delta V = (1.6 \times 10^{-19})(125,000) = 2 \times 10^{-14} \text{ J}$

b) $KE = 2 \times 10^{-14} \text{ J}$ $EPE \rightarrow KE$

c) $\frac{1}{2}mv^2 = 2 \times 10^{-14}$
 $\frac{1}{2}(9.11 \times 10^{-31})v^2 = 2 \times 10^{-14}$
 $v = 2.1 \times 10^8 \text{ m/s}$

$W = q\Delta V$

5. The potential of point A relative to point B ($V_a - V_b$) is +60V. The potential of point C relative to point B ($V_c - V_b$) is +35 V.

- $V_A - V_B$
a. What is the potential difference between A and C? 25 V
b. How much work is needed to move a charge of 4.3×10^{-6} C from A to B?
c. How much work is needed to move a charge of 4.3×10^{-6} C from B to C?
d. How much work is needed to move a charge of 4.3×10^{-6} C from A to C?

A
•
60
B
•
0
C
•
35

b) $W = q \Delta V = (4.3 \times 10^{-6}) \times 60 = 2.58 \times 10^{-4} \text{ J}$

d) $25 \times 4.3 = 1.075 \times 10^{-4} \text{ J}$

c) $35 \times 4.3 = 1.505 \times 10^{-4} \text{ J}$

6. A particle having a charge of $+3 \times 10^{-9}$ C moves from point A to point B along a straight line, a total distance of 0.5m. The electric field is uniform along this line, in the direction from a to b with magnitude of 200 N/C.

- a. Determine the force on q. $F = qE = (3 \times 10^{-9}) \times (200) = 6 \times 10^{-7} \text{ N}$

- b. Determine the work done by the field. $W = F \times d = (6 \times 10^{-7}) \times (0.5) = 3 \times 10^{-7} \text{ J}$

- c. Determine the potential difference between A and B.

$W = q \Delta V$
 $(3 \times 10^{-9}) \times (100) = 3 \times 10^{-7} \text{ J}$

$E = \frac{\Delta V}{\Delta x}$

$200 = \frac{\Delta V}{0.5}$

100V

$V = \int E \cdot dx$
 $V = E \cdot \Delta x$

$\frac{V}{0.5} = E$

$E = 200 \text{ N/C}$

7. Point charges of $+7 \times 10^{-6}$ C (point A) and -9×10^{-6} C (point B) are placed 6 cm apart (A on the left).

- a. Find the potential directly in the middle of these two points.

- b. Find the potential at a point 1 cm to the left of A.

- c. Find the potential at a point 3 cm to the right of B.

$V = \frac{kq}{r}$

$V_A = \frac{(7 \times 10^{-6}) (8.99 \times 10^9)}{(0.03)}$

$V_A = 2.126 \times 10^6 \text{ V}$

$V_B = -2.67 \times 10^6 \text{ V}$

$V_A = 5.5 \times 10^5 \text{ V}$

b) $5.1326 \times 10^5 \text{ V}$

c) $-1.9916 \times 10^6 \text{ V}$

8. A particle having a mass of 5g and charge of 2×10^{-9} C starts from rest at point a and moves in a straight line to point b. what is the speed at point b? (All objects are 1cm apart)

$V = \frac{kq}{r}$

$+3 \times 10^{-9} \text{ C}$

①

$-3 \times 10^{-9} \text{ C}$

②

$V_3 = -1348.5 \text{ V}$

$V_A = V_1 + V_2$

$\frac{k(3 \times 10^{-9})}{0.01} + \frac{k(-3 \times 10^{-9})}{0.02}$

$V_A = 2697 \text{ V} - 1348.5$

$V_A = 1348.5 \text{ V}$

$\Delta V = V_A - V_B = 2697 \text{ V}$

$kE = \frac{kq}{r^2} = \frac{k(2 \times 10^{-9})}{(0.01)^2}$

$400 = \frac{1}{2} (2 \times 10^{-9}) v^2$

$(2 \times 10^{-9}) (200) = \frac{1}{2} (5 \times 10^{-3}) v^2$

1.046 m/s
