Date: _____

Radioactive Decay and Half-Lives Worksheet

Solve #1-8. For #1-5, write a balanced equation for the nuclear reaction as shown below.

Examples:

Chlorine-36 decays by beta emission

Dubnium-262 decays by alpha emission

1. Krypton-87 decays by beta emission.
2. Curium-240 decays by alpha emission.
3. Americium-243 decays by alpha emission.
4. Phosphorus-32 decays by beta emission.
5. Lead-210 decays by beta and then alpha emission.
6. The half-life of Iodine-131 is approximately 8 days. If you start with 15 grams of Iodine-131, how much will be left after 24 days?
7. Thorium-234 has a half-life of 24 days. If 1 gram remains in a sealed container after 72 days, how much was there originally?
8. The half-life of Polonium-218 is 3.0 minutes. If you start with 20 grams of Po-218, what percentage of the original sample remains after 4 half-lives?
